

Transplant Patient

Overview

When an organ becomes available, speed of decision making is critical to a successful outcome for the patient. The Transplant Patient Solution (TPS) from Airpoint is designed to access patient data and match it to currently available organs, whenever they become available and wherever the co-ordinator is.

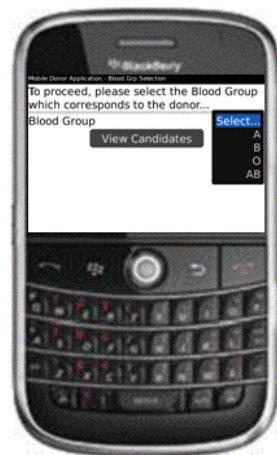

Features

- Immediate indication of suitable patients when a donor organ becomes available
- Filter patients by blood group, age and other important factors
- Match organ to patient by MELD/UKELD score
- Secure management of patient data
- Database can be accessed when co-ordinator is using the phone

Key Benefits

- Dynamic updates and confirmation remotely without the need for paper reports
- Fastest way to confirm organ/patient matching regardless of where and when it becomes available
- Patient suitability can be discussed on the phone whilst looking at the patient data
- Improved data security compared to paper patient notes carried by transplant co-ordinators

Even if your mission-critical requirements are not life-threatening, the solution can be adapted whenever inventory-to-application matching is required. All mobile, all of the time.

Airpoint specialises in developing tailored mobile solutions that deliver maximum efficiency for distributed workforces. For more information, please visit us at www.airpoint.net.
